MAT 1375, Classwork7, Fall2024

| ıD: | Name: | | | | |
|---|---|------------------------|--------------------------|--|--|
| 1. Definition of Polynomial function of | of degree $oldsymbol{n}$ in | one variable: | | | |
| A | in one variable is a function f of the form | | | | |
| $f(x) = a_n x^n +$ | $a_{n-1}x^{n-1} + \cdots$ | $\cdots + a_2 x^2 + a$ | $_{1}x^{1}+a_{0},$ | | |
| for some constants a_0 , a_1 , \cdots , a_n , where | ere≠ (|) and n is a no | on-negative integer. The | | |
| numbers a_0 , a_1 , \cdots , a_n are called | | | | | |
| The number a_n , the coefficient of the variable to the highest power, is called the | | | | | |
| | and $oldsymbol{n}$ is the $_$ | | of the polynomial. | | |

2. The **End Behavior of the polynomials** and the **Leading Coefficient Test**:

As x goes to ∞ or $-\infty$, the graph of polynomial function

$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_1 x^1 + a_0, \quad (a_n \neq 0)$$

either rises or falls eventually. Here, we can conclude this into the following table

| n is an odd number | | $\it n$ is an even number | | |
|---------------------------|-----------|----------------------------------|--|--|
| $a_n < 0$ | $a_n > 0$ | $a_n < 0$ | | |
| (,) | (,) | (,) | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | $a_n < 0$ | $a_n < 0$ $a_n > 0$ | | |

| 3. A | or | or | of a polynomial | f(x) is a number c so that | | |
|-------------------------------|--|--|------------------------------|-------------------------------------|--|--|
| f(c) = | f(c) = Each real root/zero/solution of the polynomial $f(x)$ appears as an | | | | | |
| | of the | e graph of $f(x)$. (Here | `real' means not a c | omplex number) | | |
| 4. Multipli | city of the roo | ot and x-Intercepts: | | | | |
| Let $f(x) =$ | $(x-r)^k$ wh | ere r is the | _ of f and this root | repeats times. We | | |
| call r a roo | t with | k. | | | | |
| Even Multiplicity (k is even) | | Odd Multiplicity (k is odd) | | | | |
| The graph | 1 | the x -axis and | The graph | the x -axis at the | | |
| | | at the root r . | $\operatorname{root} r.$ | | | |
| The gra | aph tends to f | flatten out near the ro | ots with multiplicity | greater than | | |
| _ | | nomial Functions: If function of degree <i>n</i> | , then the graph of <i>f</i> | has at most | | |
| turning poi | ints. | | | | | |
| 6. The esse | ential part for | drawing a complete g | raph of f : | | | |
| whe | n appro oots (which a | aches) re intercepts) wit | h the Multiplicities | v the function behaves | | |
| _ | | he values by computin | | | | |
| | | or rational functions in | • • | | | |
| • Turn | ing points wi | th Extrema (that is all ₋ | and |) | | |
